

# ASSIGNMENT 2 SYSTEM ANALYSIS AND SELECTION

Implementing The Smart Urban Management System in Metroville City

# **Prepared By:**

Tu Uyen Bui- 103517765
Phuong Linh Tang- 103844450
Long Thanh Nguyen- 104528564
Daniel Christopher Vuong- 104559577

# **EXECUTIVE SUMMARY**

This report delivers a comprehensive analysis of Metroville City's path to operational enhancement through the adoption of a Smart Urban Management System (SUMS). Beginning with an overview of Metroville's foundational operational domains, strengths, challenges, and growth vision, the report details the city's strategic implementation approach. Key business challenges are then identified and prioritized, with a focus on how a SUMS solution can effectively address these issues. Based on this assessment, we outline essential business requirements linked to specific SUMS functionalities, clarifying the potential impact of SUMS on Metroville's operations. To ensure an effective vendor selection, we recommend five criteria aligned with Metroville's operational and implementation needs. In support of a successful SUMS rollout, the report also explores change management strategies and proposes contingency plans for both pre- and post-go-live phases. Further, we assess SUMS's prospective contributions to Metroville's key operational areas, supporting the city's broader objectives. Lastly, we examine the potential benefits of upgrading Metroville's SUMS to SAP S/4HANA, considering both its capabilities and limitations. Based on case study insights and supplementary research, we recommend this upgrade as a valuable step for Metroville. This report serves as a strategic guide, offering Metroville in-depth insights to support informed decision-making and enhance its operational efficiency.

# I. KEY FINDINGS

# 1. Background and Operation

## 1.1 Background and operation

Metroville City was founded in 1950 and has experienced substantial growth, positioning itself as a hub for technology and innovation due to its strategic location and thriving economy. However, with this rapid urban expansion, the city has faced challenges common to growing metropolitan areas, including increased traffic congestion, rising energy demands, and the need for more efficient public services.

Under the leadership of Mayor Linda Hartfield, elected in 2015, the city has pursued a progressive agenda focused on integrating advanced technological solutions into its infrastructure. This vision aims to enhance operational efficiencies, improve residents' quality of life, and ensure long-term sustainability. The Metroville City Council plays a critical role in overseeing policy implementation across various urban projects. Their focus includes legislative oversight, urban planning, economic development, and the provision of community services. The Council prioritizes maintaining and upgrading infrastructure to support the city's growth, as well as fostering economic growth through investment and innovation.

## 1.2 Current Key Strengths

## 1.2. 1 Visionary Leadership and Strategic Planning

Under the leadership of Mayor Linda Hartfield, Metroville has committed to integrating advanced technologies to improve urban management and sustainability. The city's forward-thinking approach ensures that it stays at the forefront of smart city initiatives, leveraging technological advancements to enhance public services and operational efficiencies.

## 1.2.2 Economic Vitality and Innovation Hub

Metroville's vibrant economy and strategic geographic location have made it a hub for technology and innovation. This strong economic base allows for significant investment in infrastructure, technological upgrades, and urban development projects without compromising essential services. The city's economic strength also attracts foreign investment, making it conducive to business growth and fostering a competitive environment.

## 1.2.3 Robust Governance and Public Engagement

The Metroville City Council's commitment to transparency and active public engagement has built a strong relationship with the community. Regular town hall meetings and public forums allow for citizen feedback, fostering civic participation and trust in the city's governance. This participatory approach ensures that residents' needs are considered in city planning and operations.

# 1.3 Key Stakeholders & Factors affecting their relationship

Types	Identification
Internal	- Mayor and City Leadership
	Mayor Linda Hartfield and her leadership team are responsible for setting
	the strategic vision for Metroville's smart urban management. They are
	driving the integration of advanced technological solutions to improve
	public services, operational efficiency, and sustainability. Their leadership
	is pivotal in ensuring that smart city initiatives align with Metroville's
	long-term goals.
	- City Council
	The City Council, comprising elected officials from various districts,
	plays a legislative role, overseeing policy implementation and urban
	development projects. Their responsibilities include reviewing and
	approving legislation related to urban growth, public safety,
	environmental policies, and budget allocations. They work closely with
	the mayor's office and other city departments to ensure alignment with the
	city's broader strategic goals.
	- Department Heads and Senior Managers
	Leaders from city departments such as Urban Planning, Public Safety, and
	Environmental Services are critical in implementing the Smart Urban
	Management System (SUMS). Their coordination and collaboration
	across departments are essential for ensuring that new technologies
	integrate seamlessly into the city's existing operations.
	- Employees and Staff
	City employees, including public servants, planners, engineers, and
	emergency responders, are vital in the day-to-day running of Metroville's
	services. Their involvement and adaptation to SUMS are crucial for its
	successful implementation, as their interactions with the system directly
	affect operational efficiency and service delivery.

#### External

## - Residents and Community Groups

Metroville's residents and various community organizations are key external stakeholders. Their feedback and engagement are essential in shaping how the city's smart initiatives impact daily life. Ensuring transparent communication and improving quality of life through better public services are critical to maintaining strong relationships with this stakeholder group.

## - Technology Partners and Vendors

Companies like Oracle and UrbanTech Solutions, responsible for providing the technological infrastructure and services for SUMS, play a vital role. These partners are involved in system development, customization, and technical support.

## - Regulatory Bodies

Governmental and environmental regulatory agencies are external stakeholders that ensure Metroville complies with legal and environmental standards. These agencies oversee compliance with public safety laws, urban planning regulations, and sustainability practices, influencing the city's operational strategies.

## - Funding Organizations and Investors

Metroville receives financial support from government grants, private investors, and other funding organizations to help implement its smart city initiatives. These stakeholders expect accountability and transparency regarding the use of funds, with a focus on visible returns such as improved city services and sustainability outcomes.

## 1.4 Major challenges

The Metroville City case study highlights several major challenges that impede its progress and sustainability. Key issues include the increasing pressure on aging infrastructure, which is inadequate to meet the demands of a growing population and the integration of modern technologies. Urban sprawl has added to greater traffic congestion, necessitating the implementation of smart traffic systems to optimize flow. Additionally, the city's fragmented administrative operations across departments have created inefficiencies, with redundant data accumulation and poor communication hindering effective coordination. These operational

inefficiencies, combined with escalating regulatory obligations, pose significant challenges to maintaining service delivery and compliance. Environmental challenges such as pollution and the strain on natural resources, further compound these issues, requiring the city to implement environmental monitoring tools. Overall, these multifaceted challenges highlight the need for a comprehensive, scalable system to support sustainable growth and enhance operational efficiency across the city's services

## 1.5 Vision and Goals

## 1.5.1 Technological Innovation:

Metroville envisions leveraging advanced technologies to optimize public services and urban management. The city is preparing to meet future challenges while supporting its expanding population and growing technological demand.

## 1.5.2 Sustainability and Environmental Stewardship:

The city aims to reduce its carbon footprint through smart environmental monitoring systems that track air quality, manage water resources, and ensure responsible urban development.

## 1.5.3 Enhanced Quality of Life for Residents:

The city focuses on improving the quality of life for its residents. By implementing smart traffic and transportation management systems, upgrading infrastructure, and enhancing public safety Hence, Metroville is working to create a more liveable, efficient, and resilient city.

## 2. Business Problem

## 2.1 Priorty Level

The priority level of each issue is evaluated based on its urgency, categorized from high to low. This assessment allows us to focus on addressing the most critical challenges, shaping our business requirements, and establishing criteria for selecting SUMS vendors and solutions. Given the vast number of issues, diverse needs, and numerous SUMS options available, it is impossible to find a single solution that addresses every problem. Therefore, it is essential to prioritize the most pressing issues to ensure effective problem-solving.

Level of Priority	Justification	
Level of I Hority	Justification	

High	High-priority problems collectively impact residents, and city
	departments by diminishing the quality of public services,
	raising operational costs, and undermining public safety and
	economic growth.
Medium	Problems categorized as medium priority indirectly affect
	Metroville City's operational efficiency and sustainability
	such as neglected regulatory compliance issues.
	environmental sustainability problems and delays in
	integrating new technologies hinder the city's ability to
	improve services, creating inefficiencies and stalling
	Metroville's growth and innovation potential, which could
	prevent the city from reaching its smart city goals.
Low	Low-priority problems may not immediately disrupt city
	operations, but it can weaken community support for city
	initiatives. Ultimately, this can affect long-term governance
	and the success of urban projects.

2.2 Critical Business Problems faced by Metroville City from the case study.

<b>Key Problems</b>	Jusification	Priority	SUMS Solution Needed
		Level	
Aging Infrastructure	Aging infrastructure in	High	Yes. SUMS offers smart monitoring systems that can track the health of
	Metroville City poses		the city's infrastructure and trigger maintenance workflows before critical
	significant safety and		failures occur (Rodrigues et al., 2023). For instance, IoT sensors can be
	functionality risks, as it		embedded into critical infrastructure like bridges, roads, pipelines, and
	struggles to support the city's		utilities, continuously collecting real-time data on factors such as
	growing population and		structural integrity, disasters, traffic loads, etc. (Papadopoulou, 2021)
	modern technological		Overall, this preventive approach would minimize disruptions and extend
	demands (Capacci et al.,		the lifespan of key city assets. Moreover, by addressing potential issues
	2022). Failing infrastructure		early through predictive maintenance, the city can avoid expensive
	could disrupt essential city		emergency repairs and also ensure safety for pedestrians.
	services like water, electricity,		
	and transportation, leading to		
	costly emergency repairs and		
	service outages that directly		
	affect residents and businesses		
	(Beer, Kougioumtzoglou, &		
	Patelli, 2014).		

Data Management	Metroville faced the absence	High	Yes. SUMS incorporates AI-driven analytics to assist city officials in
and Real-Time	of real-time data collection		making data-informed decisions by leveraging machine learning to
Analytics	and analytics, which is		identify inefficiencies across city services (Herath & Mittal, 2022). It
	essential for quick decision-		provides recommendations to optimize resource allocation and improve
	making, especially in crisis		service delivery. By analysing historical data, SUMS can generate
	situations. Without advanced		predictions for future needs, enabling better planning and proactive
	analytics, it becomes difficult		management (Son et al., 2023). Additionally, SUMS offers a centralized
	to identify trends, make		data repository that consolidates data from various departments into a
	predictions, or optimize		single, integrated platform (Joshi et al., 2016; Kim et al., 2021). This
	resource allocation.		allows departments to collaborate more effectively, drawing from the same
			reliable pool of information, reducing redundancy, and improving data
			accuracy and reliability.
Traffic Congestion	Traffic congestion,	High	Yes. SUMS can address this issue through Intelligent Transportation
	exacerbated by urban sprawl,		Systems (ITS) solutions that optimize traffic flow, reduce congestion, and
	reduces productivity, increases		improve overall mobility (Elassy et al., 2024). By utilizing real-time data
	pollution, and delays		collection and analysis to manage traffic efficiently, Metroville can have
	emergency response times,		immediate judgments based on current traffic circumstances without the
	which could endanger lives		need for central processing delays.
	during critical situations		
	(Balbo, 1993).		

Fragmented	Fragmented administrative	High	Yes. SUMS allows an integrated platform that consolidates data from
Administrative	operations result in		various city departments into a single system (Attaran et al., 2022).
Operations	inefficiencies, slow decision-		SUMS ensures that all departments have access to the same, up-to-date
	making, and misallocation of		information, allowing for improved collaboration, communication, and
	resources, affecting the city's		coordination by using tools that have real-time data and AI-driven
	ability to respond to citizen		analytics.
	needs in a timely manner.		
Environmental	Environmental sustainability	Medium	SUMS can help Metroville address environmental issues by implementing
Monitoring and	problems, such as pollution,		an environmental monitoring system based on IoT sensors. These sensors
Resource	gradually lead to health issues,		can provide real-time data on air and water quality, waste management,
Management	reduced air and water quality,		and energy consumption, allowing the city to monitor environmental
	and strained resources,		parameters continuously (Malche et al., 2019; Narayana et al., 2024).
	ultimately raising healthcare		SUMS would enable smart responses to environmental changes, such as
	costs and impeding future		adjusting traffic to reduce emissions or managing water resources more
	urban development (Säynäjoki		efficiently (Malche et al., 2019). This ongoing monitoring ensures that
	et al., 2014; Chen, 2021).		environmental concerns are addressed proactively, promoting
			sustainability for the city's long-term development.
Regulatory	Neglected regulatory	Medium	Yes. SUMS provides tools for automating compliance tracking and
Compliance	compliance issues can result in		reporting, simplifying the process of meeting regulatory requirements.
	legal and financial penalties,		Additionally, its real-time data management capabilities help ensure that
	tarnishing the city's reputation		

	and making it harder to secure		the city's data remains accurate and up to date, further supporting
	future funding, thus		compliance and operational efficiency.
	weakening its long-term		
	financial stability (Bertaud,		
	2024). For instance, in		
	Victoria, failure to comply		
	with regulatory requirements,		
	such as maintaining proper		
	infrastructure or adhering to		
	urban planning regulations,		
	could result in penalties of up		
	to 1,200 penalty units,		
	amounting to \$237,108 in		
	fines, with additional daily		
	penalties of up to \$11,855 if		
	violations continue		
	(Department of Environment,		
	Land, Water and Planning,		
	n.d.).		
Integration of New	Delays in integrating new	Medium	Yes. SUMS can collect and process real-time data from connected devices
Technologies	technologies hinder the city's		(IoT) across the city, enhancing city services such as traffic management,

	ability to improve services,		environmental monitoring, etc (Wolniak & Stecuła, 2024). Furthermore,
	creating inefficiencies and		by processing and storing vast amounts of data through cloud computing,
	stalling Metroville's growth		SUMS enables scalability and ensures that the city's systems can handle
	and innovation potential,		growing volumes of information without delays (Liu et al., 2024).
	which could prevent the city		
	from reaching its smart city		
	goals		
Public Engagement	Although valuable for	Low	Yes. SUMS utilizes IoT and 5G to gather real-time feedback from
and Transparency	maintaining trust and		residents, ensuring quicker and more effective responses to city
	participation, public		operations. It incorporates blockchain technology to secure transactions
	engagement does not pose an		and feedback mechanisms, fostering trust among citizens (Bhardwaj et al.,
	immediate threat to city		2024; Mistry et al., 2020). Through collaborative computing with 5G,
	operations		SUMS can efficiently manage real-time public concerns, allowing for
			immediate adjustments (Son et al., 2023; Deng et al., 2021). Additionally,
			simulation technology supports policy planning and offers early warning
			systems by forecasting the potential impacts of proposed measures,
			enhancing both responsiveness and strategic decision-making in
			Metroville City.

## 3. Business Requirements

Brennan (2009) describes "business requirements" as broad goals and objectives driving a project's initiation. Identifying these requirements is crucial for selecting a software solution that meets as many businesses needs as possible, ensuring the most effective outcome. In this section, we will list Metroville's business requirements and explain how Smart Urban Management System (SUMS) addresses them. By aligning Metroville's needs with SUMS, we lay the groundwork for Task 4, selecting a vendor, and Task 8, evaluating SAP S/4HANA's fit for Metroville's operational and regulatory challenges.

In the table below, we will identify each business requirement for Metroville and propose corresponding SUMS functionalities that have the potential to effectively address these needs. The table will demonstrate how SUMS capabilities can be tailored to meet Metroville's goals for improved efficiency, service delivery, and regulatory compliance.

No	Criteria	SUMS functionality	Justification
1	System Scalability	SUMS Characteristics:	Oracle technology for SUMS provides the city with the scalability it needs due to
1	System Scalability	Flexible infrastructure  • SUMS Tools: Oracle platform	the well-built infrastructure that incorporates machine learning, multicloud, and multiple types of storage (Oracle, 2020) to suit the city's scalability needs
2	Compliance	<ul> <li>SUMS Characteristics:         <ul> <li>Flexible infrastructure</li> </ul> </li> <li>SUMS Tools: Analytical software, machine learning</li> </ul>	The centralised system that SUMS utilises provides timely data to all parts of the business. This involves notifications sent by software to notify users about budget changes and policy impacts, which are created from SUMS advanced analytical capabilities
3	Traffic management system	<ul> <li>SUMS         Characteristics:         Flexible infrastructure     </li> <li>SUMS Tools: Third party application integration</li> </ul>	The Oracle system that SUMS utilises is capable of installing many different programs which increase the amount of utility that SUMS can provide (Elbahri et al., 2019). This includes an advanced traffic management system, which helps direct and control traffic to ease congestion in the city.
4	Environment/Sustainabil ity Monitoring	SUMS Characteristics:  Flexible infrastructure	The Oracle system that SUMS utilises can install many different programs which increase the amount of utility that SUMS can provide (Oracle, 2020). Environment monitoring applications can be used with the SUMS system, which monitors

		SUMS Tools: Third party application integration	important environmental measures, such as carbon levels. This can provide the city with important statistics which can help the city make the right decisions regarding the environment.
5	Customisation	<ul> <li>SUMS Characteristics:         Flexible infrastructure     </li> <li>SUMS Tools: Oracle platform</li> </ul>	The city requires many different functions from SUMS, as they need to cater to the many different business needs that the public requires. Therefore, it is important that SUMS has the customisation to suit the city's needs. SUMS oracle technology is highly customisable, able to meet many different business requirements at once which helps fulfil the city's need for customisation (Sarfaraz et al., 2012).
6	Real time data analytics	<ul> <li>SUMS Characteristics:         <ul> <li>Forecasting capabilities</li> </ul> </li> <li>SUMS Tools: Inbuilt analytical software</li> </ul>	AI driven analytics provide real time data to users, which can help alter the government's actions in real time to help provide the public with the resources and services they need (Gain Insights with Oracle Analytics, 2021).
7	Fast response time	<ul> <li>SUMS Characteristics: Fast infrastructure</li> <li>SUMS Tools: Machine learning</li> </ul>	Real time data analytics allow for faster response times, as the information that the government needs to make decisions can be analysed and sent to the right sources.  This increased response time can be attributed to machine learning, which calculates and analyses faster than a human.
8	Administrative system	SUMS Characteristics:     Centralised command center	The central command centre allows orderly and smooth flow of data to and from places that need it. This can help greatly, as all information can be analysed in one place which preserves data integrity.

	SUMS Tools: Notifications,
	analytical software

SUMS is the ideal solution for Metroville due to its scalability, flexibility, and ability to integrate future technologies. It is designed to handle the complex, multi-layered urban environment that Metroville faces. Unlike traditional ERP systems, SUMS is tailored specifically to meet the unique needs of cities, with features such as IoT-driven real-time data collection, AI analytics, and automated response systems.

## 4. Vendor Selection Criteria

In the context of Metroville City's efforts to upgrade its Smart Urban Management System (SUMS), a thorough evaluation of potential SUMS vendors is required to ensure alignment with the city's operational and implementation needs. Selecting the right vendor is critical to the success and sustainability of Metroville's SUMS implementation. It is essential to define criteria that match Metroville's unique operational and implementation needs. The following five criteria are proposed for vendor selection, each tailored to Metroville's requirements:

Vendor Selection Criteria	How it solves Metroville's problems	Rank of priority	Justification
Customisation and Flexibility	Tailored solutions, such as smart traffic control, address Metroville's congestion and urban inefficiencies. Customisation enables the SUMS to configure features that meet specific requirements, such as integrating environmental monitoring for carbon levels or adjusting public alerts for changing traffic patterns (Khan et al., 2020; Lee et al., 2017).	High	Customisation is critical for Metroville's unique needs, allowing SUMS tools to meet specific urban challenges through features that monitor, report, and adjust in real time. This level of flexibility reduces the city's reliance on external systems, allowing processes to be more efficient and accurate.
Scalability	As Metroville grows, scalability ensures that the SUMS can handle more data and new technologies such as AI, IoT, and future city expansion. This is critical for allowing the city to expand its infrastructure without requiring large-scale upgrades, which	High	Metroville's long-term growth depends on a scalable SUMS system. Expanding urban services such as emergency notifications and resource monitoring demands

	may affect public services and raise		systems that can handle a
	costs (Ali & Miller, 2017; NetSuite,		larger user base and
	2024).		process more data without
			losing efficiency.
Data	Unified data flow improves	Medium	Integrating data across

	features as they are introduced (Ali		essential for ensuring that
	and Miller, 2017).		the SUMS adapts to
			Metroville's changing
			needs, and regular
			training enhances system
			usability, keeping
			operations running
			smoothly and employees
			informed.

# 4.1 Customisation & Flexibility

When choosing a vendor for a complex system, such as Metroville City's Smart Urban Management System (SUMS), customisation and flexibility are critical as they provide these benefits:

- Addressing Specific Urban Challenges: Metroville faces urban challenges such as traffic
  congestion and environmental monitoring requirements. A flexible system enables the city to
  implement specific solutions, such as smart traffic management systems that can adjust to
  changing traffic patterns and environmental conditions (Khan et al., 2020).
- Adapting to Technological Advancements: As technology evolves, A flexible system can ultilise advancements in AI, IoT, and data analytics (Bashiir, 2024).
- Enhancing User Experience: Customisation enables the design of user-friendly interfaces customised to the specific needs of city employees (Khan et al., 2020)

Metroville City's complex infrastructure and various difficulties highlight the importance of customisation and flexibility. The city's decision to collaborate with UrbanTech Solutions, which provided a solution based on Oracle technology. Customisation of the system to Metroville's specific

requirements was a key consideration in the vendor selection process, ensuring that the SUMS could effectively address the city's operational and strategic objectives (UrbanTech Solutions, 2016).

To catch up with the urban problems like traffic jams. The vendor should offer solutions that can be customised to the city's specific needs, such as smart traffic management or environmental monitoring tools (Lee et al., 2017). This adaptability is critical for implementing systems that support initiatives such as smart city technologies and public safety improvements (Ali & Miller, 2017).

For example: A one-size-fits-all solution will not meet Metroville's criteria.

## 4.2 Scalability:

Metroville is expanding rapidly. The chosen vendor must provide a system that is scalable to satisfy population growth and future technologies. This helps Metroville integrate with additional IoT devices, AI systems, and data analytics tools without requiring a largescale renovation. Scalability will help meet the growing demand for real-time monitoring and urban services (CIO, 2023; Zhang & Huang, 2020).

## 4.3 Data Integration Capabilities:

Metroville's systems varies across departments, resulting in inefficiencies and poor communication. As Metroville grows, SUMS will need to incorporate additional data sources and adapt to new technologies, such as IoT devices or cloud platforms

Also, the vendor must have demonstrated data integration capabilities that motivates connection between existing systems such as public safety such as traffic lights to be adjusted to prioritize emergency vehicles. For urban planning, the vendor's system may analyze incident data over time to identify high-risk areas and improve road safety designs. This would centralise data, and enable better decision-making using real-time analytics (CIO, 2023; Zhang & Huang, 2020).

## 4.4 Cybersecurity and Compliance:

Nowadays, cyber threats are on the rise, protecting sensitive information and complying with sector-specific regulations have become essential priorities for organizations in diverse industries (Patil & Seshadri, 2014). In case of Metroville city, it is essential to control the data via a variety of information sources such as public safety, transportation, and environmental monitoring which requires modern technology application. Metroville's regulatory obligations are increasing, so to meet both local and international standards is critical (Menon, Muchnick, & Butler, 2019; NetSuite, 2024). Vendor security certifications like ISO 27001 or CSA STAR could form a critical part of the vendor selection criteria to ensure robust data protection and trust in cloud services. Hence, the chosen vendor should establish a solid knowledge and understanding these regulations and systems that align with

compliance such as reporting functions customized to meet specific regulatory requirements (Harris et al., 2009).

## 4.5 Post-implementation Support:

The SUMS project requires a long-term commitment. Metroville requires continuous technical support, system updates, and employee training to function properly. The vendor must provide extensive post-implementation services, such as regular software updates, help desk support, and new feature installations, to ensure that the system adapts to changing urban management requirements (Menon, Muchnick, & Butler, 2019). For instance, post-implementation support from the vendor helps the city avoid obsolescence by facilitating structured upgrades. This is to make sure that SUMS remains up to date at least every 3 years with minimal disruptions, preventing the need for a complete overhaul and reducing long-term costs (Olson & Zhao, 2007). Furthermore, vendor post-implementation support for system optimization and employee training enhances SUMS's performance, ensuring that city staffs can effectively leverage the system with regular training and system improvements (Oseni et al., 2017). Overall, without ongoing support, SUMS may struggle to keep pace with these needs, leading to inefficiencies and operational misalignment.

## 5. Change Management Evaluation

To implement SUMS, Metroville City had to use management strategies to smoothly implement the system. The strategies they undertook can be understood using John Kotter's 8 step change model (Kotter, 1996), which consists of 8 steps: creating urgency, forming a coalition, creating a vision, communicating a vision, empowering others, gaining early wins, consolidating change and anchoring change.

## **Step 1: Creating Urgency**

Dr Simon Fredericks created the sense of urgency, making sure that the team was aware of the urgency of implementing SUMS, to ensure that the teams involved in the implementation are driven and focused on the task at hand.

## **Step 2: Forming a Coalition**

A coalition was formed when many of the city's influential leaders such as the chief of urban planning and the director of public safety came together to lead the implementation of SUMS, to help align their

workforces with the final goal. The main challenge of this step stemmed from the stakeholders having a variety of interests and personal goals, which made it hard to unite all their resources.

## **Step 3: Creating the Vision**

A vision was created by Dr Simon Fredricks, to inspire those involved with the implementation of SUMS (Ifinedo, 2008). Even after providing a vision for the project, some members of the teams were uncertain about the project, due to personal issues and uncertainties.

## **Step 4: Communicating the Vision**

Workers had the vision communicated to them through constant communication between departments to ensure that all workers got the support they needed, as well as keeping stakeholders up to date with the latest information about the project (Hamrin et al., 2016). This constant communication to workers and stakeholders was crucial in gaining the trust and understanding of these parties, but underwent the risk of misunderstandings, should the information be communicated the wrong way.

## **Step 5: Empowering Others**

Training helped empower workers, giving them the skills needed to complete their jobs. This came in the form of a learning-based strategy, which involved providing oracle systems to all future users to help familiarise themselves with the system. This approach helped get their employees used to the systems they would need to use in the future, but lacked the actual elements of the final product, such as user interface which may not provide an authentic training experience (McKenzie & Woodruff, 2013).

## **Step 6: Gaining Early Wins**

The early wins came from the successful initial start of SUMS positive feedback, to help keep morale of the teams high. These provided the boost for the team to continue in their implementation but were hampered by the delay of the system (Kramer, 2011).

## **Step 7: Consolidating Change**

The momentum of the change was continued and consolidated through the constant addition of more features to SUMS, such as real time traffic management systems. These continued wins helped maintain

the team's morale to provide more efficient work. The momentum was also aided by the positive feedback that came from the departments that utilised SUMS.

## **Step 8: Anchoring Change**

The changes were anchored through more post implement training of the related parties that would be using SUMS. This helped finalise the change in the minds of employees, to establish it as a part of day-to-day business and solidify its place in their operations. Feedback from users however asked for the training to be less intensive, as they trained the employees too little on the basics. While the accelerated learning plan had helped those who were more competent with technology, the less technology literate of the users was left confused.

Steps	Description	Metroville City's Application	Evaluation

# 6. Implementation Strategy

# 6.1. Implementation Plan

Since SUMS project is developed in the public sector, the best practice of ERP implementation from the case study of the Canadian government is adopted to ensure a successful SUMS implementation. According to Kumar et al. (2002), the "ERP Systems Experience Cycle" framework consists of four phases: chartering, project configuration, shakedown and onward/upward.

The project-chartering phase involves all activities and decision-making processes that lead to the approval of SUMS (Kumar et al., 2002). In the context of Metroville City, the project chartering phase was initiated by Dr. Simon Fredericks as the Chief Technology Officer when he pushed the idea of SUMS forward. Following this is the analysis of organisational fit, vendor fi, budget and other resources, risks, etc. to assess the possibility of SUMS project (Anwar & Mohsin, 2011).

The project configuration phase consists of activities needed to set up SUMS and get it running in Metroville (Kumar et al., 2002). This phase includes the development of project plan, training users, selection of team members and ongoing project management (Kumar et al., 2002). This phase was demonstrated in the context of Metroville City in how visionary leaders came together and form a team and how training was tailored to each department, ensuring that there is limited user resistance to the system. Testing of the system was also conducted in this phase to assess the readiness for the implementation.

Shakedown is the most critical phase in SUMS implementation (Kumar et al., 2002). This phase refers to the period after configuration until normal operations are restored (Kumar et al., 2002). In the case of Metroville City, this phase includes additional training to departments, reviewing regulatory compliance and constant improvements and reflection.

Phased rollout was implemented in the SUMS project. Phased implementation is adopted when one functional module is made up and running at a time which requires less resources and allows users to gradually adapt to the new system (Anwar & Mohsin, 2011). Phased implementation allowed Metroville to identify issues in traffic and public safety modules, leading to delayed go-live date.

## 6.2. Risk matrix

To develop a comprehensive contingency plan for implementing SUMS in Metroville City, we first identify the risks associated with the SUMS project in the pre go-live and post go-live stage, using the risk matrix to rank these risks based on its impact on the project and its stakeholders alongside with its probability of occurrence (Murray et al., 2011).

Category	Risk name	Impact	Probability	Assessment of
				Risk
Pre go-live	Pre go-live Risk 1: Lack of top management support		4	Extreme
	Risk 2: Data loss or corruption during migration	5	4	Extreme
	Risk 3: Data incompatibility issues		3	High
	Risk 4: Cost overruns	3	3	Medium
Post go-live	Risk 5: Resistance to change among users	5	5	Extreme

Risk 6: Delays in addressing user concerns and feedback	4	3	High
Risk 7: Delays in solving system issues and updating systems	4	3	High
Risk 8: System Downtime and failures	5	3	Very High
Risk 9: Cybersecurity threats	5	4	Extreme
Risk 10: Lack of vendor support	4	2	Medium

Table 1: Risks involved with implementing SUMS

		Impact				
		Insignificant	Minor	Significant	Major	Severe
Likelihood		1	2	3	4	5
	5 Very Likely	Medium	High	Very High	Extreme	Extreme
	4 Likely	Medium	Medium	High	Very High	Extreme
	3 Possible	Low	Medium	Medium	High	Very High
	2 Unlikely	Very Low	Low	Medium	Medium	High
	1 Very Unlikely	Very Low	Very Low	Low	Medium	Medium

Table 2: Risk matrix (Murray et al., 2011)

After assessing the risks involved with implementing SUMS in Metroville City, four main risks labelled as "Extreme" are *Risk 1: Lack of top management support, Risk 2: Data loss or corruption during migration* during the pre-go-live stage, *Risk 5: Resistance to change among users* and *Risk 9: Cybersecurity threats* during the post go-live stage. With a clear vision of the extreme risks, two contingency strategies are developed in each phase to provide Dr. Fredericks with a detailed action plan in these worst-case scenarios.

## 6.2. Contingency plans for pre-go-live phase

#### *6.2.1. Top management engagement strategies*

Top management support is considered the most important factor throughout the SUMS implementation stages including the initiation or pre-go-live phase (Somers & Nelson, 2004). The complexities and risks associated with SUMS project require high levels of involvement from top management in financial and personnel support to prevent cost overruns and facilitate positive attitudes among employees towards the project (Barth & Koch, 2019). Additionally, the need for management support is highly emphasised in government project like SUMS due to budget restrictions in government organisations (Mpanga, 2019). Leader engagement is also vital in change management process in government settings, ensuring high user acceptance of SUMS (Iftikhar et al., 2011). As evident in the case of Metroville, performance of a department enhanced significantly when its leaders embraced the system.

Lack of top management commitment is one of the most common reasons for project failure (Loonam et al., 2018); therefore, it is pivotal to develop contingency plans before the SUMS goes live to deal with this risk. The contingency measures include providing incentives, replacement of disengaged top management leader and forming a steering committee to distribute responsibility.

Contingency measures	Detailed plan	Personnel	Justification
1. Provide incentives	Step 1: Establish a formal	Chief	Employee's performance
to leaders to boost	performance measure with clear	Operating	is better when the
engagement	criteria	Officer	compensation is closely
	Step 2: Link performance metrics	(COO),	tied to their efforts and
	with incentives	Human	performance (Heinrich &
	Step 3: Communicate incentives	Resources	Marschke, 2010).
	clearly	(HR) and	Providing incentives
	Step 4: Closely monitor top	Project	sends a message that
	manager's performance and adjust	Management	Metroville City Council
	compensation model if needed	Office (PMO)	is interested in applying
			SUMS and appreciate the
			additional time and
			efforts leaders spent on
			the project (Legare,
			2002)
2. Replace	Step 1: Establish a formal	Human	Disengagement from
disengaged leaders	performance metrics	Resources	leaders can lead to
with more		personnel,	project delays and high

leader	conditions for replacement (e.g.	manager	Koch, 2019). Replacing
	consistent demonstration of lack		such leaders with more
	of interest in the project)		committed ones ensures
	Step 3: Create a pool of		better project leadership
	alternative executives with history		and decision-making.
	of successful projects		
	Step 4: Closely monitor project		
	leaders' performance		
	Step 5: Replace disengaged		
	leaders		
3. Form a steering	Step 1: Appoint key members	PMO, Heads	According to Ahmad &
committee to	from each department in	of key	Pinedo Cuenca (2013),
distribute	Metroville City Council to be in	departments	steering committee with
responsibility	the committee		executive leadership is
	Step 2: Define key responsibilities		one of the critical success
	for each member of committee		factors for ERP
	Step 3: Schedule and hold regular		implementation. Dividing
	meetings for updates		responsibility among
			leaders helps reduce
			reliance on one
			individual and ensures
			accountability from
			multiple sources.

Table 1: Contingency measures and detailed plan for lack of top management support

## 6.2.2. Data backup and recovery plan

Data migration and conversion are critical in the initial stages of SUMS project as availability and timeliness of accurate data play a fundamental role in effectively implementing ERP systems (Somers & Nelson, 2004). Since ERP system like SUMS is highly integrated with organisation and business processes, a significant number of transactional data in daily business activities is entered into the new system (Hussain et al., 2018). Challenges can arise from converting disparate data structures into a consistent format before the system goes live (Somers & Nelson, 2024). Considering in the case of Metroville where Dr. Frederick has a vision of SUMS as a central hub providing access to real-time data collection, data migration is especially important in the pre-go-live stage of SUMS, preventing

data loss and ensuring business continuity. Thus, comprehensive contingency plans should be developed in cases where there are errors in the process of entering data to the system.

Contin	gency measures	Detailed plan	Personnel
1.	Develop a	Step 1: Identify important stages in data	Head of IT department, IT
	rollback plan	migration process that might require a	department, PMO
		rollback plan	
		Step 2:	
		Step 3: Run rollback plan under different	
		possible scenarios	
		Step 4: Train IT staff to execute the	
		rollback plan when needed	
2.	Back-up	Step1: Perform backup on master and	IT department, Data
	system data	transactional data stored in existing	management team
	before	system	
	migration	Step 2: Store the back up in encrypted	
		cloud	
		Step 3: Verify the backup for data	
		integrity	
3.	Conduct mock	Step 1: Setup a test environment to	IT department, Data
	data	simulate the migration	management team
	migrations	Step 2: Run mock migrations to assess	
		data and system compatibility	
		Step 3: Document any problem that arise	
		and address them	
		Step 4: Adjust the migration plan	

# 6.3. Contingency plans for post go-live phase

## 6.3.1. User feedback and change management plan

The adoption of SUMS is an organization-wide change that, without effective management, can lead to resistance, errors and redundancies within the organization (Somers & Nelson, 2004; Iftikhar et al., 2011). Moreover, in a case study conducted by Iftikhar et al. (2011) which focused on the implementation of ERP in public organisations, most of the users were reported to be against the transition to an automated system as they feared loss of jobs or changes in current jobs. In the context of Metroville City, user resistance was observed among administrative staff whose roles are closely attached to the old municipal systems. This has led to challenges in adapting the new technology.

Thus, a comprehensive change management program should be developed to deal with high risk of resistance to change often associated with ERP projects and build user acceptance of new technology (Finney & Corbett, 2007). Top management support also has a significant influence on the level of user resistance (Iftikhar et al., 2011). However, this factor is managed pre-post go live (See <u>6.2.1. Top management engagement strategies</u>). Contingency measures that project leaders should adopt to minimize user resistance include creating a feedback loop, establishing a specialised team management team and customising training approach according to user needs.

Contingency measures	Detailed plan	Personnel	Justification
1. Create a feedback	Step 1: Select feedback	IT support	Lack of clear feedback
loop that allows users	channels (e.g. online	team, Change	mechanisms and change
to report issues and	forms, in-person	management	management can lead to
suggest improvements	interviews, emails, etc.)	team	resistance and negative

	Step 2: Review and prioritise to address feedback based on urgency Step 3: Communicate changes and actions taken to users		attitudes of users towards the new system, hindering the success of SUMS (Venkatraman b& Fahd, 2016).
Form a change management team	Step 1: Form a team with project champions from each department Step 2: Schedule regular meeting to collect reviews and attitudes on the systems Step 3: Implement changes and updates Step 4: Review changes and adjust	Change Management team, IT department	
3. Customise training approach according to user needs	Step 1: Assess users' technical proficiency and job requirements to develop training program Step 2: Hold regular meetings with each head of department to identify difficulties in adoption Step 3: Adjust and tailor training programs for each department based on feedback and requirements Step 4: Review and offer ongoing support for departments	HR, Heads of key Departments	Training of system users plays a critical role in effective change management in ERP implementation (Iftikhar et al., 2011).

## 6.3.2. Cybersecurity measures

The growing reliance on information and communication technologies (ICTs) has led to increased risks of cyberterrorism and cyber attacks across various industries (Wirtz & Weyerer, 2016). Government or public administration are one of the industries experience the most attempts of cyber attacks as reports on cybersecurity showed (Wirtz & Weyerer, 2016). In Australia, cybercrime continues to be one of the major threats (Defence, 2023). From 2021-22, reports of cybercrime in Australia saw a 23 per cent increase (over 94,000 reports) (Defence, 2023).

The implementation of SUMS would make Metroville city become more reliant on IoT networks and centralised data hub to manage its critical functions which increases the likelihood of potential data breaches and cyber threats. This highlights the need for comprehensive contingency plan for such scenarios to protect Metroville and its stakeholders against data vulnerabilities, ensuring that the city complies with security regulations.

Contingency measures	Detailed plan	Personnel	Justification	
1. Create an Incident Response Plan (IRP)	Step 1: Create a comprehensive IRP with clear protocols for recognising and responding to incidents Step 2: Define clear responsibilities for each team member of the IT department when an accident occurs Step 3: Conduct training and simulations Step 4: Review and update IRP	IT department	IRP provides Metroville with a comprehensive framework for cyber risk management to ensure business continuity (Shinde & Kulkarni, 2021)	
2. Perform vulnerability assessments regularly	Step 1: Schedule regular vulnerability assessment and penetration testing Step 2: Analyse the findings and prioritise to address vulnerabilities based on risk level Step 3: Adopt security measures accordingly	IT department	-Vulnerability assessment and penetration testing (VAPT) gives Metroville a thorough evaluation of potential threats so that critical vulnerabilities can	
3. Establish a disaster recovery plan	Step 1: Create a disaster recovery plan for data backup and system recovery Step 2: Test the plan in simulations to ensure effectiveness Step 3: Update the plan if needed	IT department	be addressed (Shinde & Ardhapurkar, 2016) -VAPT helps prevent network downtime caused by breach, unauthorised access and data corruption (Shinde & Ardhapurkar, 2016)	

# 7. Value Realisation

SUMS offers values to four key areas of Metroville city's urban management: Traffic and Public Safety Management, Environmental Sustainability
Initiatives, Infrastructure Upgrades and Maintenance and Crisis Response and Management. Based on the business requirements provided in part 3: Business
Requirements, this section will critically assess how SUMS benefits these aspects of urban management through key criteria: data management, real-time data
analytics, automation, scalability and flexibility, stakeholder collaboration, compliance and alignment with strategic goals. These criteria emphasise how
SUMS supports Metroville's vision for a smarter and more sustainable urban management.

Area of Urban	Data	Real-Time	Automation	Scalability and	Stakeholder	Compliance	Alignment with Metroville's

# 8. Sap S4/Hana Analysis And Recommendations

# 8.1 SAP assessment

The following table provides an assessment of SAP S/4HANA as a potential SUMS solution for Metroville. The evaluation is based on the business requirements of Metroville, as highlighted in our previous discussions in section 4. This assessment aims to guide Metroville in making an informed decision regarding their SUMS system upgrade.

Business	SAP capabilities		
Requirements		SAP Strengths	SAP weaknesses

# 8.2 Recommendation regarding its business requirement

An in-depth analysis of SAP S/4HANA's suitability for Metroville City is conducted for Metroville to proceed with the SAP S/4HANA upgrade. This recommendation stems from a thorough case study evaluation and an assessment of Metroville's unique challenges and requirements, as outlined in the table below:

Requirements	Recommendation	Justification
System	Upgrade to SAP S/4HANA with a focus	Upgrading to SAP S/4HANA on the cloud allows Metroville to scale resources as its needs grow,
Scalability	on cloud capabilities, leveraging SAP's	accommodating more data, users, and functionalities without requiring major infrastructure
	Cloud Platform for increased scalability,	changes (Ali & Miller, 2017). Load balancing will efficiently distribute resources, reducing system
	and implementing load balancing	overloads and improving performance during peak demand periods, which is critical for
	solutions.	Metroville's growing urban environment (SAP, 2023).
Compliance	Implement SAP's Compliance	SAP's integrated compliance tools improve Metroville's regulatory tracking across departments by
	Management Tools, which include	automating routine compliance checks and ensuring timely regulatory updates. Automated alerts
	automated workflows for reporting,	shorten response times, reducing the risk of violations and penalties in a highly regulated urban
	tracking, and regular updates, as well as	management environment (Menon et al., 2019; NetSuite, 2024).
	compliance alert configuration.	
Traffic	Integrate SAP with IoT-enabled traffic	Metroville's IoT integration provides real-time traffic information, allowing for predictive traffic
Management	management solutions like SAP	signal adjustments and reduced congestion. SAP's Connected Vehicle solutions analyse traffic
System	Connected Vehicle, allowing real-time	patterns and optimise signal timing, which is critical to Metroville's goal of reducing delays and
	data analysis and signal timing	improving emergency response times in congested areas (Khan et al., 2020).
	optimization.	

Environment/	Implement SAP's Environmental,	SAP EHS provides early environmental monitoring and centralised sustainability reporting, which
Sustainability	Health, and Safety (EHS) Solutions,	are critical for Metroville's goal of meeting urban sustainability targets. Dashboards and KPIs help
Monitoring	including sustainability dashboards for	departments stay on track with emission reduction targets and make faster decisions about
	emissions tracking, and establish KPIs	resource allocation and environmental policies (Bashiir, 2024; SAP, 2022).
	for environmental metrics.	
Customization	Use SAP's Flexible Architecture for	Metroville's need for specialised features, such as traffic or environmental monitoring, is met by
	modular custom applications; develop	its flexible architecture. SAP Fiori's customisable interfaces enhance the user experience for city
	custom apps with SAP Fiori for tailored	employees, ensuring that the system meets Metroville's operational requirements and operates
	user interfaces that meet city-specific	effectively with high user engagement (Lee et al., 2017; Sullivan, 2022).
	needs.	
Real-Time Data	Use SAP HANA's in-memory	SAP HANA's in-memory capabilities enable immediate data processing, which is critical for
Analytics	computing for real-time analytics;	Metroville's real-time decision-making in crisis or high-demand situations. Live dashboards
	create live dashboards and predictive	provide real-time insights, while predictive analytics assist the city in forecasting future
	analytics to visualise and forecast	challenges, such as traffic bottlenecks and environmental concerns (CIO, 2023; SAP, 2023).
	trends.	
Fast Response	Use SAP Data Hub to improve data	The Data Hub's streamlined integration capabilities reduce data transfer delay time, allowing
Time	integration and flow across	Metroville to obtain faster, more accurate insights across departments. Automated data collection
	departments; automate data collection	allows for faster updates and responses, which is essential for public safety and efficient resource
	processes.	management (Khan et al., 2020; Sullivan, 2022).

Administrative	Centralize operations using SAP	Workflow Management streamlines administrative tasks, reducing redundancy and increasing
System	Workflow Management to standardize	operational transparency across departments. This centralised approach enables Metroville's staff
	processes and increase administrative	to more effectively respond to resident needs while also reducing service request processing times
	efficiency.	(Ali & Miller, 2017; SAP, 2021).

# 8.3 Recommendation regarding identified vendor selection criteria

Considering Metroville's requirements and the vendor selection criteria identified for SUMS, SAP S/4HANA presents itself as a strong candidate. Its capabilities in customization, scalability, data integration, cybersecurity, and post-implementation support closely align with Metroville's urban objectives.

Requirements	Recommendation	Justification
Customisation	Use a flexible implementation strategy	The city can choose an approach that aligns with their needs, budget, and infrastructure
and Flexibility	when integrating new technologies with	capabilities among various options.
	SAP S/4HANA such as on- premise,	Morover, it can intergraed for faster adaptation to technological changes, keeping the city
	cloud and hybrid,	innovative and efficient (Aslam & Raza, 2022).
		The cloud infrastructure will enhance operational efficiency and reliability, improving public
		safety and services (Babu & Desai, 2023).
	Upgrade to a cloud-based SAP	
	S/4HANA solution that offers	Real-time analytics will improve decision-making during crises, allowing the city to allocate
	scalability and modernization of city	resources more effectively (Aslam & Raza, 2022).
	services.	

	Implement SAP S/4HANA's real-time analytics features for immediate data processing and insights.	
Scalability	Leverage SAP S/4HANA's Scalable Architecture to support the integration of additional IoT devices, AI-powered services, and data analytics tools.	SAP's scalability will allow Metroville to integrate more with:  IoT devices: traffic sensors or environmental monitors- for monitoring real-time data from multiple sources and allow for quicker data-informed decisions.  AI Predictable data analysis helps Metroville to be proactive in planning and processing operations like predict energy use or traffic.  Data analytics for processing large volumes of data efficiently which enhancing city's urban planning strategies, contributing to Metroville's long-term goals.
		Overall, without a significant overhaul, SAP's architecture allows easy scaling across multiple environments which is easier for managing the rapid population growth and technological expansion anticipated in Metroville.
Data Integration Capabilities	Utilize SAP S/4HANA's integrated traffic management systems to monitor and control urban traffic.	Smart traffic solutions can reduce congestion, improving quality of life and resource allocation (Dreiling & Vögele, 2021). By centralizing traffic data, SAP S/4HANA empowers Metroville to gather real-time insights on traffic patterns, congestion hotspots, and peak hours, facilitating timely adjustments to improve traffic flow.  A centralized system will minimize redundancy and enhance communication (Sullivan, 2022).  Unified data fosters a collaborative environment where all departments work with a common

		understanding of the city's needs and resources, ultimately providing better, more cohesive
	Upgrade SAP S/4HANA's integration	services to its residents.
	capabilities to unify data across	
	departments.	
Cybersecurity	Use SAP S/4HANA's compliance	SAP S/4HANA's security framework is equipped with robust data protection measures, including
and Compliance	features: Audit trails and automated	certifications like ISO 27001 and CSA STAR, which help ensure data integrity and regulatory
	regulatory	compliance. Not only SAP /4HANA help to simplify compliance processes and reduce
		administrative costs but also help Metroville minimizes manual compliance efforts and reduces the
		risk of non-compliance due to outdated information by aligning with the latest industry standards
		and government regulations (Dreiling & Vögele, 2021). Furthermore, the capabilities of audit trail
		would help Metroville in monitoring track of changes across operations (SAP, 2024).
Post-	Leveraging SAP's Customer Interaction	With SAP's support, this can help Metroville ensure that SUMS remains up-to-date and adaptable,
implementation	Center (CIC)- direct access to	allowing the city to avoid obsolescence and costly system reimplementations. Through the CIC,
Support	experienced SAP advisors (SAP, n.d.).	SAP advisors offer customized scalability planning, helping Metroville to scale SUMS without the
		costly disruptions associated with system overhauls (SAP, n.d.)
		. This includes assessing current and projected data loads, advising on infrastructure adjustments,
		and implementing SAP S/4HANA's best practices for managing increased demand. Furthermore,
		CIC support can assist in identifying and deploying new system functionalities or enhancements as
		Metroville's urban management needs evolve (SAP, n.d.). By utilizing SAP CIC for scalability
		guidance, Metroville will ensure SUMS is consistently equipped to handle future growth,
I		safeguarding both the city's investment and the long-term effectiveness of the system.

# II. CONCLUSION

This report has thoroughly examined Metroville City's journey toward becoming a smart city, identifying its strengths and primary challenges. Our evaluation of Metroville's operational landscape emphasizes the importance of aligning business challenges with strategic priorities, revealing significant potential for SUMS solutions to address these issues effectively. Through this analysis, we outlined eight core business requirements crucial for Metroville's success, alongside tailored selection criteria to guide the city in choosing a vendor capable of delivering a SUMS solution suited to its unique needs. Morover, the report explored change management strategies employed by Metroville in navigating the transformational SUMS implementation, evaluating these approaches through the lens of Kotter's model. The necessity of contingency planning for both pre- and post-go-live phases was underscored to ensure operational continuity and manage risks throughout the implementation process. Finally, an assessment is conducted about the prospective impact of SUMS on Metroville's operations, specifically considering an upgrade to SAP S/4HANA. Our comprehensive analysis of SAP S/4HANA's capabilities, strengths, and limitations indicates that this upgrade would strategically position Metroville to align with industry best practices. To conclude, upgrading to SAP S/4HANA is recommended in Metroville as a decisive step toward achieving its smart city vision.
